

## Convergence in Probability

Let  $Y_1, Y_2, Y_3, \dots$  be a sequence of random variables (which can be dependent or independent). Let  $a \in \mathbb{R}$ , we say that  $Y_n$  converges to  $a$  in Probability, if

$$\forall \epsilon > 0, \quad \lim_{n \rightarrow \infty} \Pr(|Y_n - a| > \epsilon) = 0$$

or

$$\Pr(Y_n \notin (a - \epsilon, a + \epsilon)) = 0$$

### 0.1 Limit of a sequence

If  $a_1, a_2, \dots, a_{n+1}, \dots$  is a sequence of reals where,  $a : \mathbb{N} \rightarrow \mathbb{R}$ ,  $a_n \in \mathbb{R}$

So  $(a_n)$  has a limit  $l \in \mathbb{R}$  if the following is true;

$$(\forall \epsilon > 0) (\exists N \in \mathbb{N}) (\forall n \in \mathbb{N}) (n > N \implies |a_n - l| < \epsilon)$$

We say that the sequence of Random variables  $Y_1, Y_2, \dots, Y_n, \dots$  converges in probability to  $a \in \mathbb{R}$  if;

$$\forall \epsilon > 0 \quad \lim_{n \rightarrow \infty} \Pr(|Y_n - a| > \epsilon) = 0$$

Consider a sequence of *iid* random variables  $X_1, X_2, \dots, X_n, \dots$ , with  $\mathbb{E}[X_i] = \mu$  and  $\text{Var}(X_i) = \sigma^2$ .

We define Sample mean as follows;

$$M_n = \bar{X}_n = \frac{\sum_{i=1}^n X_i}{n}$$

Note that  $M_1, M_2, \dots, M_n$  is also a sequence of random variables with  $\mathbb{E}[M_1] = \mathbb{E}[M_2] = \dots = \mathbb{E}[M_n] = \mu$  and  $\text{Var}[M_n] = \frac{\sigma^2}{n} = \mathbb{E}[M_n - \mu]^2$ . So as  $n$  increases  $\text{Var}(M_n)$  tends to  $\mu$  as it gets smaller and smaller. Which gives us the Weak law of large numbers.

## Weak Law of Large numbers

Let  $M_n$  be a sequence of sample means generated from *iid* sample  $X_n$  with  $\mathbb{E}[X_i] = \mu$  and  $\text{Var}[X_i] = \sigma^2$  then  $M_n$  converges in probability to  $\mu$
